Agent workflow: three agents, three human checkpoints

How one workout becomes next week's plan, and how the trainer knows who to check in with

CHECK-IN LOOP · any time the dashboard loads

Guardrails

- AI output is checked: known exercises, reps ≤ 200, weight ≤ 2,000 lbs. One retry.
- Client data is wrapped as data, so it can't give the model orders.
- If a model fails, the client's text stays saved to retry, a saved log is never lost, and check-ins fall back to a plain draft.
